Project 2 Report

Overall, I really like how this project came out. I would say that I am most proud of the headers as I liked how it turned out with the use of the background images. If I had more time I probably could have made the spacing of everything a little cleaner and nicer looking. With the time I was given I did end up changing quite a bit from the first version I turned in. For example, I did the following: I moved the navigation to the very top of the page, I added a page for volunteering, I added a little more visual flair to the lunch debt page, I made the spacing more even across the different pages compared to what it was, I fixed some of the wording I used, added dropdowns to the cards on the about page, increased image fluidity, etc.

For this project I mainly just used a lot of Bootstrap in both the code snippets and the icons for the socials at the bottom.

For this project I made some design decisions that some may not agree with but I overall think were good decisions. For example, I put header images on all of the pages to give them some uniformity and break up the use of the light background color so the pages weren't as bland. When I first turned this site in I used the bootstrap container class quite a bit but after working on it more I realized the container-fluid class would work better with the content that I have. The color scheme and fonts were all chosen by my client so I didn't have a say in any of those but I believe that I put them to good use. On the about page I customized a typical accordion to turn it into single dropdowns for every card. I kept the two rows of cards linked together so when you click on one dropdown it drops the whole row because otherwise the cards extended but there was no content. So I figured it made more sense that if they were going to extend anyway then I might as well save people the clicks and have the whole row open. I also

decided that the look of cards with rounded corners worked better with the site so I customized all of the cards that I used to have at least rounded corners.

In terms of advanced features I would say that figuring out how the accordion worked so I could use it how I wanted to was pretty advanced. I would also say that before this project I wasn't super comfortable with background images so I would have considered using them to the extent that I did in this project to be more advanced for my skill level.

While working on this project I really struggled with the image grids as I completely forgot about the bootstrap img-fluid class and thus was trying to make my images fluid by myself and succeeded with some and failed with others. With these grids I also struggled to decide on a look and the amount of columns that I wanted to use. I did eventually remember the img-fluid class and also improved with the grid layouts that bootstrap provides and that made the process of redoing my image grids much easier.
